ITSM Incident Knowledge Base

RAG-ready source document generated from the uploaded ITSM workbook. Each incident is presented as a self-contained record to support text extraction, chunking, semantic retrieval, and evidence-based answers.

Dataset size: 800 incident records. Source workbook sheets: ITSM_Records, Priority_Guidelines, Category_Guidelines, SLA_Guidelines, Data_Dictionary.

Data note: This is synthetic benchmark data. SLA rules and target values below are defined by the workbook. Active incident SLA labels are tied to the fixed reference timestamp specified in SLA_Guidelines.

1. ITSM policy and reference material

Priority and SLA guidelines

P1 — target resolution time: **1 hours**; response target: **15 minutes**.

Critical service or widespread outage; high impact and high urgency

Escalation: Declare major incident when criteria are met; engage incident commander and service owner.

P2 — target resolution time: **4 hours**; response target: **30 minutes**.

Significant service degradation or critical function unavailable

Escalation: Escalate to specialist support and notify service owner if risk of SLA breach.

P3 — target resolution time: **24 hours**; response target: **240 minutes**.

Moderate impact with limited scope or workaround available

Escalation: Service Desk coordinates; escalate when workaround fails or scope expands.

P4 — target resolution time: **72 hours**; response target: **480 minutes**.

Low impact, localized issue, or non-critical interruption

Escalation: Handle in normal queue; communicate expected resolution and escalate if impact increases.

SLA breach interpretation

P1 (target 1 hours): Resolved/Closed: breached if resolution_hours > target_hours. Active: breached if elapsed hours since created_at > target_hours at validation time. Elapsed wall-clock hours from created_at to 2026-10-11 12:00 local reference time; use a fixed as_of timestamp for reproducible evaluation.

P2 (target 4 hours): Resolved/Closed: breached if resolution_hours > target_hours. Active: breached if elapsed hours since created_at > target_hours at validation time. Elapsed wall-clock hours from created_at to 2026-10-11 12:00 local reference time; use a fixed as_of timestamp for reproducible evaluation.

P3 (target 24 hours): Resolved/Closed: breached if resolution_hours > target_hours. Active: breached if elapsed hours since created_at > target_hours at validation time. Elapsed wall-clock hours from created_at to 2026-10-11 12:00 local reference time; use a fixed as_of timestamp for reproducible evaluation.

P4 (target 72 hours): Resolved/Closed: breached if resolution_hours > target_hours. Active: breached if elapsed hours since created_at > target_hours at validation time. Elapsed wall-clock hours from created_at to 2026-10-11 12:00 local reference time; use a fixed as_of timestamp for reproducible evaluation.

Incident category guidance

Hardware: Disk Array, Docking Station, Headset, Laptop, Network Switch, Printer. Default assignment group: Workplace Support. Use Hardware when the primary fault is in this technology or service domain.

Software: Browser, CRM, ERP, Office Suite, Payroll, VPN Client. Default assignment group: Application Support. Use Software when the primary fault is in this technology or service domain.

Network: Corporate Wi-Fi, DNS, Firewall, Load Balancer, Proxy, WAN Link. Default assignment group: Network Operations. Use Network when the primary fault is in this technology or service domain.

Database: Data Warehouse, MongoDB, Oracle Database, PostgreSQL, Redis, SQL Server. Default assignment group: Database Operations. Use Database when the primary fault is in this technology or service domain.

Security: Access Management, Email Security, Endpoint Protection, Identity Provider, SIEM, Vulnerability Scanner. Default assignment group: Identity and Access. Use Security when the primary fault is in this technology or service domain.

Cloud: API Gateway, Cloud Database, Container Registry, Kubernetes, Object Storage, Virtual Machine. Default assignment group: Cloud Platform. Use Cloud when the primary fault is in this technology or service domain.

Email: Calendar Service, Distribution List, Email Archive, Exchange Online, Mail Gateway, Shared Mailbox. Default assignment group: Messaging and Collaboration. Use Email when the primary fault is in this technology or service domain.

Application: Customer Portal, Document Management, HR Portal, Payment Service, Reporting Service, Workflow Engine. Default assignment group: Application Support. Use Application when the primary fault is in this technology or service domain.

Field definitions

incident_id: Unique incident identifier; one row per incident.

priority: P1-P4 operational priority; target SLA is defined in SLA_Guidelines.

sla_target_hours: Resolution SLA target derived from priority; P1=1, P2=4, P3=24, P4=72 hours for this synthetic benchmark.

sla_breached: For Resolved/Closed, compares resolution_hours with target. For active incidents, compares elapsed time to a fixed reference timestamp of 2026-10-11 12:00.

resolution_hours: Populated only for Resolved/Closed incidents; blank for active incidents.

description: Detailed synthetic incident narrative with scope, symptoms, and investigation context; not production/customer data.

root_cause: Confirmed cause for Resolved/Closed; may be under investigation for active tickets.

resolution: Remediation for Resolved/Closed incidents; blank for active tickets.

created_at: Incident creation timestamp in local naive datetime format; synthetic benchmark reference time is 2026-10-11 12:00.

2. Incident records

Each incident below is a separate, labeled record. Use incident_id as the primary identifier when answering questions and cite relevant incident IDs in generated answers.

Category: Application

Incident INC2026000005

Incident ID: INC2026000005

Short description: Document Management: document preview fails for PDF files (post-change issue)

Description: Users can upload documents but PDF previews fail to render. The affected scope is two departments; the service does not complete within the expected time. The service owner requested validation before the incident is closed. Support should validate the fix against the affected service and confirm recovery with the requester.

Incident INC2026000415

Incident ID: INC2026000415

Short description: Payment Service: payment requests time out (user impact)

Description: Payment requests time out while the upstream provider is responding slowly. The affected scope is one user; the service does not complete within the expected time. Monitoring confirms the issue is reproducible and not limited to one browser session. Support should validate the fix against the affected service and confirm recovery with the requester.

Incident INC2026000612

Incident ID: INC2026000612

Short description: Payment Service: payment requests time out (intermittent failure)

Description: Payment requests time out while the upstream provider is responding slowly. The affected scope is a regional office; the service works for some users but not others. The problem affects more than one user and is delaying a business process. Support should validate the fix against the affected service and confirm recovery with the requester.

Incident ID: INC2026000414

Short description: Kubernetes: pods remain in CrashLoopBackOff (post-change issue)

Description: A production deployment repeatedly restarts and does not become ready. The affected scope is one user; the service fails consistently. A temporary workaround is available, but the underlying fault remains. Support should validate the fix against the affected service and confirm recovery with the requester.

Category: Cloud

Incident INC2026000049

Incident ID: INC2026000049

Short description: Redis: cache hit ratio drops sharply (access issue)

Description: Application latency increases while cache hit ratio falls below its normal range. The affected scope is one user; the service fails consistently. No related security alert was found during the initial triage. Support should validate the fix against the affected service and confirm recovery with the requester.

Category: Database

Configuration item: Redis

Business service: Data Services

Priority: P2

Impact: High

Urgency: High

Status: Closed

Incident INC2026000324

Incident ID: INC2026000324

Short description: PostgreSQL: database connections exceed configured limit (access issue)

Description: The application reports connection failures during peak transaction volume. The affected scope is a regional office; the service fails intermittently. The requester supplied timestamps and an example transaction for investigation. Support should validate the fix against the affected service and confirm recovery with the requester.

Category: Database

Configuration item: PostgreSQL

Incident INC2026000530

Incident ID: INC2026000530

Short description: PostgreSQL: database connections exceed configured limit (access issue)

Description: The application reports connection failures during peak transaction volume. The affected scope is a small group of users; the service fails consistently. The requester supplied timestamps and an example transaction for investigation. Support should validate the fix against the affected service and confirm recovery with the requester.

Incident INC2026000006

Incident ID: INC2026000006

Short description: Email Archive: archived messages cannot be retrieved (user impact)

Description: Users receive errors when searching archived email older than one year. The affected scope is two departments; the service stops working after authentication. The incident may be related to a recent configuration or deployment change. Support should validate the fix against the affected service and confirm recovery with the requester.

Category: Email

Incident INC2026000065

Incident ID: INC2026000065

Short description: Firewall: approved application traffic is blocked (user impact)

Description: Traffic to an approved business application is dropped at the perimeter firewall. The affected scope is a production service; the service does not complete within the expected time. A temporary workaround is available, but the underlying fault remains. Support should validate the fix against the affected service and confirm recovery with the requester.

Incident INC2026000284

Incident ID: INC2026000284

Short description: Endpoint Protection: endpoint agent stops reporting telemetry (intermittent failure)

Description: Several managed endpoints have stopped sending security telemetry. The affected scope is a small group of users; the service fails consistently. No related security alert was found during the initial triage. Support should validate the fix against the affected service and confirm recovery with the requester.

Incident INC2026000547

Incident ID: INC2026000547

Short description: Email Security: legitimate messages are quarantined (post-change issue)

Description: Business emails from a trusted partner are being quarantined. The affected scope is two departments; the service stops working after authentication. Monitoring confirms the issue is reproducible and not limited to one browser session. Support should validate the fix against the affected service and confirm recovery with the requester.

Incident INC2026000773

Incident ID: INC2026000773

Short description: Email Security: legitimate messages are quarantined (post-change issue)

Description: Business emails from a trusted partner are being quarantined. The affected scope is multiple remote users; the service works for some users but not others. A temporary workaround is available, but the underlying fault remains. Support should validate the fix against the affected service and confirm recovery with the requester.

Category: Security

Incident INC2026000213

Incident ID: INC2026000213

Short description: VPN Client: VPN connection fails after update (access issue)

Description: Remote users cannot establish a VPN tunnel after the latest client update. The affected scope is a small group of users; the service does not complete within the expected time. The service owner requested validation before the incident is closed. Support should validate the fix against the affected service and confirm recovery with the requester.
