ITSM RAG Knowledge Base — Version 2

Document corpus generated from a separate 800-record synthetic ITSM dataset. Records are labeled with stable incident IDs and fields to support retrieval, chunking, and source-grounded answers.

Dataset contains incident records and policy reference sheets. It is synthetic benchmark data, not production data. Active-ticket SLA labels use the fixed reference timestamp 2026-10-11 12:00.

Priority and SLA Reference

P1: target resolution 1 hours; first response target 15 minutes. Critical outage or major service impact; engage major-incident process where applicable.

P2: target resolution 4 hours; first response target 30 minutes. Significant degradation or critical function unavailable; notify service owner when risk rises.

P3: target resolution 24 hours; first response target 240 minutes. Moderate impact with limited scope or workaround; monitor for scope expansion.

P4: target resolution 72 hours; first response target 480 minutes. Low impact or localized issue; manage in normal queue and communicate expected timing.

SLA rules

P1: SLA breached when resolution_hours > target_hours. Active tickets: SLA breached when elapsed hours from created_at to 2026-10-11 12:00 exceed target_hours.

P2: SLA breached when resolution_hours > target_hours. Active tickets: SLA breached when elapsed hours from created_at to 2026-10-11 12:00 exceed target_hours.

P3: SLA breached when resolution_hours > target_hours. Active tickets: SLA breached when elapsed hours from created_at to 2026-10-11 12:00 exceed target_hours.

P4: SLA breached when resolution_hours > target_hours. Active tickets: SLA breached when elapsed hours from created_at to 2026-10-11 12:00 exceed target_hours.

Category reference

Network: configuration items: DNS Resolver, Firewall, Load Balancer, Proxy Gateway, SD-WAN, Wi-Fi Controller. Example groups: Infrastructure, Network Operations, Security Operations. Classify as Network when the primary failure belongs to this technology or service domain.

Database: configuration items: Data Warehouse, MongoDB, Oracle, PostgreSQL, Redis, SQL Server. Example groups: Data Engineering, Database Operations, Infrastructure. Classify as Database when the primary failure belongs to this technology or service domain.

Security: configuration items: Directory Services, Email Security, Endpoint Protection, Identity Provider, SIEM Connector, Vulnerability Scanner. Example groups: Identity and Access, Security Operations. Classify as Security when the primary failure belongs to this technology or service domain.

Cloud: configuration items: API Gateway, Container Registry, Kubernetes, Managed Database, Object Storage, Virtual Machine. Example groups: Cloud Platform. Classify as Cloud when the primary failure belongs to this technology or service domain.

Business Application: configuration items: CRM, Document Portal, ERP Purchasing, HR Portal, Payment Service, Workflow Engine. Example groups: Application Support, Business Applications. Classify as Business Application when the primary failure belongs to this technology or service domain.

Workplace: configuration items: Docking Station, Headset, Laptop, Printer, Software Suite, VPN Client. Example groups: Application Support, Network Operations, Workplace Support. Classify as Workplace when the primary failure belongs to this technology or service domain.

Messaging: configuration items: Calendar Sync, Distribution List, Email Archive, Mail Transport, SPF Configuration, Shared Mailbox. Example groups: Identity and Access, Messaging and Collaboration. Classify as Messaging when the primary failure belongs to this technology or service domain.

Incident Records

Use incident_id as the record identifier. The PDF keeps each record together and labels each field to improve retrieval accuracy.

Category: Business Application

Incident INC2026V200006

Incident ID: INC2026V200006

Short description: Document Portal: PDF preview fails for uploaded files — service degradation

Description: Documents upload successfully but preview workers return an error. The affected scope is a small group; the service returns an unexpected error. The incident may relate to a recent configuration or software change. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200196

Incident ID: INC2026V200196

Short description: Workflow Engine: approval remains pending after all approvals — access issue

Description: The request remains open even though all approvers completed their tasks. The affected scope is one employee; the service returns an unexpected error. The team is checking logs before applying a permanent change. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200426

Incident ID: INC2026V200426

Short description: HR Portal: leave balance differs from approved ledger — post-change report

Description: Employees see a balance inconsistent with approved leave transactions. The affected scope is several remote users; the service fails consistently. The requester provided timestamps and a reproducible example. Support should validate recovery with the requester and confirm the service is stable.

Incident ID: INC2026V200272

Short description: Virtual Machine: CPU remains saturated after batch completion — service degradation

Description: API response times remain high even after a scheduled batch ends. The affected scope is a small group; the service returns an unexpected error. The team is checking logs before applying a permanent change. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200663

Incident ID: INC2026V200663

Short description: API Gateway: requests intermittently return 502 — access issue

Description: Clients receive gateway errors while the backend is under load. The affected scope is a regional office; the service fails intermittently. The incident is being tracked against the affected service's operational objective. Support should validate recovery with the requester and confirm the service is stable.

Category: Cloud

Configuration item: API Gateway

Business service: Cloud Platform

Priority: P3

Impact: Low

Urgency: Medium

Status: Closed

Assignment group: Cloud Platform

Assigned to: agent048

Requested by: user0151

Business unit: Research

Region: Germany - Frankfurt

Location type: Office

Channel: API

Vendor: Dell

Root cause: Backend connection pool reaches capacity

Resolution: Adjusted connection-pool settings and validated error-rate recovery

Created at: 2026-04-02 06:55:00

First response minutes: 106

Resolution hours: 38.89

Incident INC2026V200647

Incident ID: INC2026V200647

Short description: MongoDB: secondary replica lag increases after batch ingestion — user impact

Description: Read queries served from a secondary return stale results. The affected scope is several remote users; the service does not complete within the expected time. The issue affects a business workflow with a documented workaround. Support should validate recovery with the requester and confirm the service is stable.

Category: Database

Configuration item: MongoDB

Business service: Data Services

Priority: P1

Impact: High

Urgency: High

Status: Resolved

Assignment group: Database Operations

Assigned to: agent016

Requested by: user0841

Business unit: Legal

Region: US - Austin

Location type: Office

Channel: API

Vendor: Microsoft

Root cause: Disk I/O contention delays replication writes

Resolution: Moved the batch workload to its approved window and verified lag recovered

Created at: 2026-03-19 19:37:00

Incident ID: INC2026V200586

Short description: Distribution List: former member still receives group mail — user impact

Description: Messages continue to reach a removed distribution-list member. The affected scope is several remote users; the service responds slower than baseline. Other regions report normal service, suggesting a localized scope. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200775

Incident ID: INC2026V200775

Short description: Shared Mailbox: newly granted user cannot open mailbox — access issue

Description: Mailbox access fails even though permission was recently granted. The affected scope is a small group; the service responds slower than baseline. The requester provided timestamps and a reproducible example. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200109

Incident ID: INC2026V200109

Short description: Load Balancer: one backend remains marked unhealthy — user impact

Description: Traffic is not routed to one application instance after maintenance. The affected scope is several remote users; the service returns an unexpected error. A second user reproduced the issue from a separate workstation. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200267

Incident ID: INC2026V200267

Short description: Load Balancer: one backend remains marked unhealthy — service degradation

Description: Traffic is not routed to one application instance after maintenance. The affected scope is one employee; the service returns an unexpected error. Monitoring confirms the symptom is reproducible. Support should validate recovery with the requester and confirm the service is stable.

Category: Network

Incident INC2026V200431

Incident ID: INC2026V200431

Short description: Firewall: approved API calls are denied at the perimeter — user impact

Description: A partner integration receives connection resets despite an approved request. The affected scope is one employee; the service fails intermittently. Monitoring confirms the symptom is reproducible. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200126

Incident ID: INC2026V200126

Short description: SIEM Connector: events from a cloud account are missing — access issue

Description: The monitoring dashboard omits audit events for one account. The affected scope is two departments; the service returns an unexpected error. Support compared the failure with the last known successful transaction. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200622

Incident ID: INC2026V200622

Short description: Endpoint Protection: managed endpoint stops sending telemetry — service degradation

Description: Security console shows no recent events from a group of laptops. The affected scope is a regional office; the service returns an unexpected error. A second user reproduced the issue from a separate workstation. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200799

Incident ID: INC2026V200799

Short description: Identity Provider: MFA approval notifications arrive late — access issue

Description: Users cannot complete sign-in promptly because approval prompts are delayed. The affected scope is a production service; the service fails intermittently. The incident may relate to a recent configuration or software change. Support should validate recovery with the requester and confirm the service is stable.

Incident INC2026V200385

Incident ID: INC2026V200385

Short description: Headset: meeting application cannot detect microphone — post-change report

Description: The microphone is absent from the device list after a driver update. The affected scope is several remote users; the service returns an unexpected error. Support compared the failure with the last known successful transaction. Support should validate recovery with the requester and confirm the service is stable.
